

ADYDADDY

AI-Proof Marketer

How to save your performance-marketing job from AI, by using AI better than anyone else.

STARTER

Rs 499 | one-time payment | instant PDF delivery

By Vibhor Sharma, Founder of AdyDaddy

A practical playbook for performance marketers.

What you get in Starter

- The 3 core prompt templates, copy-paste ready.
- A 20-hook prompt bank for ad creative.
- A one-page AI glossary in plain English.

How to read this playbook

Read each chapter in order once. Then keep it open as a reference and run the prompts as you work. The value is in using it, not just reading it.

01 | MODULE

The Reality Check

What AI actually does to performance-marketing roles, and why the people who survive are the ones who learn to direct it.

Why the fear is real, but the panic is wrong

Every day there is a new headline about AI writing ads, building audiences, or 'running your entire funnel.' If your job is mostly copy-paste, upload, and report, that fear is justified. If your job is deciding what to test, why it won, and where to spend the next rupee, AI is not your replacement. It is your leverage.

What AI is genuinely good at

- Producing first drafts fast: ad copy, hooks, landing headlines, email subject lines.
- Summarising long data: turning 40 rows of ad metrics into a plain-English story.
- Generating variations: 20 hook options from one angle in seconds.
- Structuring work: account naming, test plans, briefs, checklists.
- Explaining concepts: how a bid strategy works, what a metric means.

What AI is still bad at

- Judgement under ambiguity: knowing when a 'winning' ad is a fluke.
- Accountability: owning a revenue number and living with the result.
- Context: knowing your brand, your founder, your customer, your constraints.
- Taste and brand safety: what fits the brand voice and what would embarrass the client.

TIP

Your job is moving up the stack: from doing the work, to deciding what work matters and directing AI to do the rest.

The core insight of this course

AI will not replace the performance marketer. A performance marketer who uses AI well will replace the one

who does not. This course turns you into the first kind. The job you are saving is your own, and the tool you use to save it is the same tool everyone is scared of.

02 | MODULE

AI Literacy for Marketers

How these models work well enough to use them well: strengths, failure modes, and how to stop getting generic output.

How a large language model actually thinks

An LLM is a next-word predictor trained on a huge slice of the internet. It does not know your account, your brand, or your numbers. It predicts what a confident expert would say next. That is why it sounds authoritative and why it is wrong about 15 to 30 percent of specific facts. Treat it as a brilliant, fast, sometimes-wrong junior.

The three failure modes to watch for

- Hallucination: making up a metric, a benchmark, or a 'best practice' that never existed.
- Generic output: safe, average advice because you gave it no context to be specific.
- Overconfidence: answering a question it should have pushed back on instead.

The fix for all three: context, role, and format

Generic output is almost always a prompt problem, not a model problem. The single highest-leverage habit in this course is writing prompts that give the model a role, your context, and the exact format you want back. Chapter 3 is entirely about this.

Pick one model and go deep

ChatGPT, Claude, and Gemini are all good enough. Do not chase every new release. Pick one you can pay for (the free tiers rate-limit exactly when you need them), learn its voice and its quirks, and build everything in this course on it. Switching tools weekly is a productivity tax, not a skill.

TIP

Paid tiers matter: they unlock longer context (paste a whole campaign export), better reasoning, and image and web capabilities you will use every day.

The Marketer's Prompt Playbook

The frameworks that turn AI from a novelty into a daily workhorse: role, context, task, format, and the iteration loop.

The R.C.T.F. framework

- Role: 'You are a senior performance marketer at a D2C fashion brand.'
- Context: paste the brand, the audience, the goal, the numbers you have.
- Task: one clear ask, not five bundled questions.
- Format: table, 5 bullets, a 3-line summary, a JSON list. Tell it the shape.

TIP

The more specific the role and context, the less generic the output. A one-line prompt gets a one-line answer you could have Googled.

The iteration loop: generate, judge, refine

Never accept a first draft as final. The workflow that actually ships work is: generate, read it critically, tell the model exactly what is wrong ('tone is too corporate, make it sharper, shorter, more direct'), and regenerate. Two or three rounds beats one long perfect prompt.

Prompting patterns that pay off in marketing

- 'Act as' a buyer persona, then ask what would make them click.
- 'Show me 10 versions, then rank them' to force range and comparison.
- 'Explain the reasoning first, then give the answer' for decisions.
- 'What am I missing?' after any plan, to surface blind spots.
- 'Rewrite this for X' where X is a specific audience, channel, or character limit.

Your first three reusable prompts

1. A campaign-summary prompt: paste raw ad data and get a plain-English read of what is working. 2. A

hook-machine prompt: one angle in, twenty hooks out. 3. A briefing prompt: turn a messy client note into a clean creative brief. Build these three, save them, and you already use AI daily.

Now go run it.

AI will not replace the performance marketer. A performance marketer who uses AI well will replace the one who does not. You just became the first kind.
